IN THE CLAIMS:

1 1. (Currently amended) A method for megasonic cleaning ~~a~~ substrate, comprising the  
2 steps of:

3 a) providing a container having sidewalls on all sides of said container,  
4 wherein at least two of said sidewalls have an overflow, said container  
5 having a container inlet for flowing fluid into said container, said container  
6 inlet located below said overflows;

7 b) providing at least one from the group including consisting of a first  
8 megasonic transducer with a first active surface and a first array of  
9 megasonic transducers with a first array active surface for providing  
10 vibrational energy in said container;

11 c) providing a substrate having a side that includes a conductive film and  
12 disposing a said substrate in said container within said sidewalls[[,]] and  
13 below said overflow, wherein said side is facing, and substantially parallel  
14 to, and spaced a first spacing from at least one from the group including  
15 consisting of said first active surface and said first array active surface;

16 d) immersing the said substrate in said fluid, flowing said fluid upwardly in  
17 said container from said container inlet, through said first spacing, and over  
18 said overflows; and

19 e) applying energy to at least one from the group including said first  
20 megasonic transducer and said first array of megasonic transducers to  
21 provide vibration in said fluid and to clean the substrate wherein  
22 substantially all vibration provided in said fluid is from at least one from the

837BUS-X

23 group including consisting of said first megasonic transducer, said first array  
24 of megasonic transducers, a transducer arranged parallel to said first active  
25 surface, and a transducer arranged parallel to said first array active surface.

1 2. (previously presented) A method as recited in claim 1, further comprising providing  
2 relative motion between said substrate and said transducer while performing said  
3 fluid-flowing and energy-applying.

1 3. (Currently amended) A method as recited in claim 1, wherein said substrate has a  
2 substrate surface area and at least one from the group including consisting of said  
3 first active surface and said first array active surface has an area at least equal to 40%  
4 of the substrate surface area.

1 4. (previously presented) A method as recited in claim 1, wherein the substrate has a  
2 maximum diameter and said first spacing is in a range from 1% to 80% of said  
3 maximum diameter.

1 5. (previously presented) A method as recited in claim 1, wherein said first spacing is in  
2 a range from 1 micrometer to 160 millimeters.

1 6. (Currently amended) A method as recited in claim 1, wherein said megasonic energy  
2 applied to at least one from the group including consisting of said first megasonic  
3 transducer and said first array of megasonic transducers has a frequency of at least  
4 400 kilohertz.

1 7. (Currently amended) A method as recited in claim 1, wherein said megasonic energy  
2 applied to at least one from the group including consisting of said first megasonic  
3 transducer and said first array of megasonic transducers has a maximum power of at  
4 least 400 watts.

- 1 8. (Currently amended) A method as recited in claim 7, wherein said megasonic energy  
2 is applied to at least one from the group including consisting of said first megasonic  
3 transducer and said first array of megasonic transducers with 20% to 100% of said  
4 maximum power.
- 1 9. (previously presented) A method as recited in claim 1, wherein said first megasonic  
2 transducer has an area and a total input power and wherein said input power divided  
3 by said area is at least four watts per square centimeter.
- 1 10. (previously presented) A method as recited in claim 1, wherein said flowing said  
2 fluid upwardly in said container comprises flowing said fluid through said first  
3 spacing at a fluid flow rate sufficient to carry particles away from the substrate before  
4 they redeposit on the substrate.
- 1 11. (previously presented) A method as recited in claim 1, wherein said container has a  
2 volume and wherein said flowing said fluid comprises flowing said fluid through  
3 said first spacing at a rate to replace said fluid in said volume in less than or equal to  
4 one minute.
- 1 12. (Currently amended) A method as recited in claim 1, further comprising providing at  
2 least one from the group including consisting of a second megasonic transducer with  
3 a second active surface and a second array of megasonic transducers with a second  
4 array active surface in said tank, wherein at least one from the group including  
5 consisting of said second active surface and said second array active surface faces at  
6 least one from the group including consisting of said first active surface and said first  
7 array active surface, and is substantially parallel to and spaced a second spacing from  
8 at least one from the group including consisting of said first active surface and said  
9 first array active surface.

1 13. (Currently amended) A method as recited in claim 12, further comprising completely  
2 immersing in said fluid at least one from the group including consisting of said first  
3 megasonic transducer and said first array of megasonic transducers and at least one  
4 from the group including consisting of said second megasonic transducer and said  
5 second array of megasonic transducers .

1 14. (Currently amended) A method as recited in claim 12, further comprising disposing  
2 the substrate in said container between at least one from the group including  
3 consisting of said first active surface and said first array active surface and at least  
4 one from the group including consisting of said second active surface and said  
5 second array active surface.

1 15. (previously presented) A method as recited in claim 14, further comprising flowing  
2 said fluid through said second spacing.

1 16. (previously presented) A method as recited in claim 15, further comprising applying  
2 energy to said second megasonic transducer.

1 17. (previously presented) A method as recited in claim 12, wherein said first megasonic  
2 transducer and said second megasonic transducer provide energy to clean both sides  
3 and edges of the substrate.

1 18. (previously presented) A method as recited in claim 1, wherein said fluid comprises  
2 one of deionized water, dilute RCA cleaning solution and dilute citric acid solution.

1 23. (currently amended) A method for megasonic cleaning a single substrate, comprising  
2 ~~the steps of:~~

3 a) providing a container comprising at least one from the group including  
4 consisting of a first megasonic transducer with a first active surface arranged in a  
5 horizontal plane and a first array of megasonic transducers with a first array  
6 active surface arranged in a horizontal plane, wherein at least one from the group  
7 including consisting of said first megasonic transducer and said first array of  
8 megasonic transducers is held in a fixed position, and wherein said container has  
9 sidewalls on all sides, wherein at least two of said sidewalls have an overflow,  
10 wherein said container ~~having~~ has a container inlet for flowing fluid into said  
11 container, wherein said container inlet is located below said overflows;

12 b) providing a single substrate having a side that includes a conductive film and  
13 disposing a said single substrate in said container within said sidewalls, below  
14 said overflow, wherein said side is facing, and substantially parallel to, and  
15 spaced a spacing from at least one from the group consisting of said first active  
16 surface ~~or~~ and said first array active surface;

17 c) immersing ~~the~~ said single substrate in a fluid and flowing said fluid upwardly in  
18 said container from said container inlet, through said spacing, and over said  
19 overflows; and

20 d) applying energy to said first megasonic transducer wherein substantially all  
21 vibration provided in said fluid is from at least one from the group including  
22 consisting of said first megasonic transducer, said first array of megasonic  
23 transducers, a transducer arranged parallel to said first active surface and a  
24 transducer arranged parallel to said first array active surface.

1 59. (Currently Amended) A method for megasonic cleaning a single substrate,  
2 comprising ~~the steps of~~:

3 (a) providing a container having sidewalls on all sides of said  
4 container, wherein at least two of said sidewalls have an overflow ,  
5 said container having a container inlet for flowing fluid into said  
6 container, said container inlet located below said overflows;

7 (b) providing a first megasonic transducer with at least one from the  
8 group including consisting of a first active surface and a first array  
9 of megasonic transducers with a first array active surface, wherein  
10 at least one from the group including consisting of said first active  
11 surface and said first array active surface is arranged in a horizontal  
12 plane to provide megasonic vibration in said container;

13 (c) providing a single substrate having a side that includes a  
14 conductive film and disposing a said single substrate in said  
15 container within said sidewalls, below said overflow, wherein said  
16 side is and facing, substantially parallel to, and spaced a first  
17 spacing from at least one from the group including consisting of  
18 said first active surface and said first array active surface, wherein  
19 said single substrate is within said sidewalls and below said  
20 overflows;

21 (d) providing a fluid in said container, immersing said single substrate  
22 in said fluid, and flowing said fluid upwardly in said container  
23 from said container inlet, through said first spacing, and over said  
24 overflows; and

25 (e) applying energy to said first megasonic transducer, wherein  
26 substantially all vibration provided in said fluid is from at least one  
27 from the group including consisting of said first megasonic  
28 transducer, said first array of megasonic transducers, a transducer  
29 arranged parallel to said first active surface and a transducer  
30 arranged parallel to said first array active surface.

1 60. (previously presented) A method as recited in claim 59, wherein said single substrate  
2 has a substrate surface area and said first active surface or said first array active  
3 surface has an area at least equal to 40% of the substrate surface area.

1 61. (previously presented) A method as recited in claim 59, wherein said single substrate  
2 has a substrate surface and said first megasonic transducer or said first array of  
3 megasonic transducers is larger than said substrate surface.

1 62. (previously presented) A method as recited in claim 59, wherein the single substrate  
2 has a maximum diameter and said first spacing is in a range from 1% to 80% of said  
3 maximum diameter.

1 63. (previously presented) A method as recited in claim 59, wherein said first spacing is  
2 in a range from 1 micrometer to 160 millimeters.

1 64. (Currently amended) A method as recited in claim 59, wherein said megasonic  
2 energy applied to said first megasonic transducer or said first array of megasonic  
3 transducers has a frequency of at least 400 kilohertz.

1 65. (Currently amended) A method as recited in claim 59, wherein said megasonic  
2 energy applied to said first megasonic transducer or said first array of megasonic  
3 transducers has a maximum power of at least 400 watts.

- 1 66. (Currently amended) A method as recited in claim 65, wherein said megasonic  
2 energy is applied to at least one from the group including consisting of said first  
3 megasonic transducer and said first array of megasonic transducers with 20% to  
4 100% of said maximum power.
- 1 67. (previously presented) A method as recited in claim 59, wherein said first megasonic  
2 transducer has an area and a total input power and wherein said input power divided  
3 by said transducer area is at least four watts per square centimeter.
- 1 68. (previously presented) A method as recited in claim 59, wherein said flowing said  
2 fluid comprises flowing said fluid through said first spacing at a fluid flow rate  
3 sufficient to carry particles away from the single substrate before they redeposit on  
4 the single substrate.
- 1 69. (previously presented) A method as recited in claim 59, wherein said container has a  
2 volume and wherein said flowing a fluid comprises flowing a fluid through said  
3 space between the single substrate and said transducer at a rate to replace the fluid in  
4 said volume in less than or equal to one minute.
- 1 70. (Currently amended) A method as recited in claim 59, further comprising providing  
2 at least one from the group including consisting of a second megasonic transducer  
3 with a second active surface and a second array of megasonic transducers with a  
4 second array active surface in said tank, wherein at least one from the group  
5 including consisting of said second active surface and said second array active  
6 surface faces at least one from the group including consisting of said first active  
7 surface and said first array active surface, and is substantially parallel to and spaced a  
8 second spacing from at least one from the group including consisting of said first  
9 active surface and said first array active surface.

- 1 71. (Currently amended) A method as recited in claim 70, wherein further comprising  
2 completely immersing in said fluid at least one from the group including consisting  
3 of said first megasonic transducer and said first array of megasonic transducers and at  
4 least one from the group including consisting of said second megasonic transducer  
5 and said second array of megasonic transducers .
- 1 72. (Currently amended) A method as recited in claim 70, further comprising disposing  
2 the single substrate in said container between at least one from the group including  
3 consisting of said first active surface and said first array active surface and at least  
4 one from the group including consisting of said second active surface and said  
5 second array active surface.
- 1 73. (previously presented) A method as recited in claim 72, further comprising flowing  
2 said fluid through said second spacing.
- 1 74. (previously presented) A method as recited in claim 73, further comprising applying  
2 energy to said second megasonic transducer.
- 1 75. (previously presented) A method as recited in claim 70, wherein said first megasonic  
2 transducer and said second megasonic transducer provide energy to clean both sides  
3 and edges of the single substrate.
- 1 76. (previously presented) A method as recited in claim 59, wherein said fluid comprises  
2 one of deionized water, dilute RCA cleaning solution and dilute citric acid solution.
- 1 77. (Currently amended) A method as recited in claim 1, wherein at least one from the  
2 group including consisting of said first megasonic transducer and said first array of  
3 megasonic transducers is larger than said substrate.

1 78. (previously presented) A method as recited in claim 23, wherein said first megasonic  
2 transducer is larger than said single substrate.

1 79. Cancel

1 80. (Currently amended) The method as recited in claim 1, wherein at least one from the  
2 group including consisting of said first active surface and said first array active  
3 surface is arranged in a horizontal plane.

1 81. (Withdrawn) The method as recited in claim 1, wherein at least one from the group  
2 including consisting of said first active surface and said first array active surface is  
3 arranged in a vertical plane.

82.-98 cancel

1 99. (previously presented) A method as recited in claim 2, wherein said providing  
2 relative motion between said substrate and said transducer is in a direction  
3 substantially parallel to the substrate.

1 100. (New) A method as recited in claim 1, wherein said conductive film includes a  
2 metallic film.

1 101. (New) A method as recited in claim 23, wherein said conductive film includes a  
2 metallic film.

3 102. (New) A method as recited in claim 59, wherein said conductive film includes a  
4 metallic film.
